Flow Rate Monitoring for Potable Water – RFO-PW Type

4.5 to 24 VDC Pulsed Output

FDA-compliant rotor and bodies for compatibility with potable water applications. Gems Sensors popularized the RotorFlow® sensor's paddlewheel design by combining high visibility rotors with solid-state electronics that are packaged into compact, panel mounting housings. They provide accurate flow rate output with integral visual confirmation...all with an unprecedented price/performance ratio. The RFO-PW Potable Water RotorFlow® sensor features a VDC pulsed output for potable water applications where a flow rate monitoring sensor is needed.

Typical Applications

• Water Purification/Dispensing Systems • Chemical Injection Systems

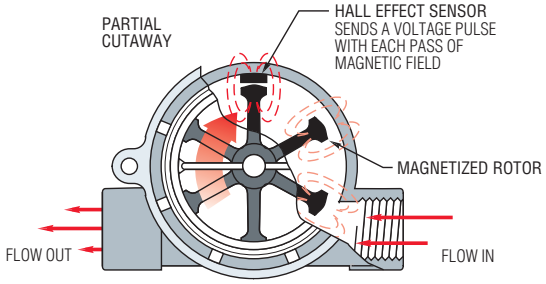
Operating Principle



1. As liquid passes through the RotorFlow® body, the magnetic rotor spins at a rate proportional to flow. This causes a series of magnetic fields (the rotor vanes) to excite the Hall Effect sensor, producing a series of voltage pulses.

2. The output pulses (RFO) are at the same voltage level as the input (4.5 - 24 VDC) with a frequency proportional to the flow rate. The output signal can be utilized by digital rate meters totalizers or other electronic controllers. RFA Type analog sensors condition the output signal to 0-10 VDC.

3. RotorFlow® Indicators may be mounted with flow entering either port. Performance is optimized by positioning ports at the top of the unit, in a horizontal plane.

Signal Output

Output signal for RFO Types is an on/off pulse of the DC voltage supplied to the unit, it is compatible with all digital logic families. Input voltage range is 4.5 to 24 VDC. Frequency of the output pulse is proportional to the flow rate and ranges from approximately 15 Hz at low flow to 225 Hz at high flow.
